OF

Anand Institute of Management & Information Science - Anand

Submitted to

GUJARAT TECHNOLOGICAL UNIVERSITY

**As a partial fulfillment of the degree of Master of Computer
Applications (MCA) DECEMBER 2025**

PREFACE

Completing this project report is an essential part of the Master of Computer Applications (MCA) program and represents an important bridge between theoretical learning and practical implementation. The work titled **“Farm to Market Service”** reflects the technical knowledge, analytical skills, and project development experience gained throughout the course of the program.

This study addresses the critical challenges faced by farmers in transporting agricultural produce to nearby markets, managing timely logistics, and accessing reliable information. The research highlights the need for a centralized digital platform that enables farmers to book transportation, locate nearby vehicles, view live market availability, and streamline the movement of both produce and livestock. Developing this system allowed me to apply concepts from software engineering, system analysis, web development, database design, geolocation technologies, and user interface principles to a real-world agricultural logistics problem.

Throughout this work, I gained meaningful insights into post-harvest management, rural transportation limitations, supply-chain inefficiencies, and the role of digital solutions in reducing losses and improving farmer profitability. The project also strengthened my understanding of how technology can support sustainable agricultural practices by minimizing delays, reducing spoilage, and improving overall market accessibility.

The process of completing this project has been highly enriching. It enhanced my technical proficiency, practical problem-solving abilities, and research-oriented approach while contributing significantly to my academic and professional development in the field of computer applications.

ACKNOWLEDGEMENT

The successful completion of this project titled “**Farm to Market Service**” has been made possible through the support, guidance, and encouragement of various individuals and institutions who contributed to this academic journey.

First and foremost, I extend my sincere gratitude to **Ms. Biral Gadhavi**, my project guide at **Anand Institute of Management & Information Science**, Anand, for her continuous support, valuable guidance, and constructive feedback throughout the development of this work. Her mentorship greatly helped in shaping the direction of the project and improving its overall quality.

I would also like to express my appreciation to all the respected faculty members of the MCA Department for their constant encouragement, academic assistance, and cooperation, which contributed significantly to the successful completion of this project.

My heartfelt thanks go to **Gujarat Technological University (GTU)**, Anand, for providing me the opportunity to undertake this project as part of the Master of Computer Applications curriculum.

Special appreciation is extended to the farmers, vehicle owners, and respondents who participated in the survey. Their insights and practical inputs were valuable in understanding the real-world challenges of agricultural transportation and strengthened the relevance of this study.

Lastly, I offer my deepest gratitude to my family and friends for their continuous motivation, patience, and emotional support throughout the preparation of this project. Their encouragement has been a constant source of strength and inspiration during this entire journey.

Kuldip Dharmeshkumar Rana

Title: Farm to Market service

Team Details:

❖ Kuldip D. Rana [245010694037]

Problem Statement:

“Approximately 30% of agricultural produce is lost due to the lack of reliable and timely transportation and logistics infrastructure, resulting in significant post-harvest losses. Farmers often struggle to access vehicles when needed, especially in rural areas, leading to delays that cause perishable goods to spoil before reaching the market.”

Solution Approach:

To tackle this challenge, we are building a user-friendly web application that bridges the gap between local farmers and vehicle owners in their vicinity. The platform enables farmers to quickly and conveniently book trucks, tempos, or tractors for on-demand transportation of their agricultural produce from farms to markets.

- **Farmers** can easily access and reserve nearby vehicles either for immediate transport or for scheduled pickups, ensuring their perishable goods reach markets promptly and in good condition.
- **Vehicle owners and drivers**—including those who operate trucks, tempos, and tractors—can register on the platform to offer their transportation services, creating new income opportunities within the local community.
- This solution is designed to minimize post-harvest losses by enhancing access to reliable transportation, boost farmers’ earnings by reducing spoilage and delivery delays, and optimize the efficiency of last-mile logistics in the agricultural supply chain.

Objectives:

- **Provide Easy Access to Transportation**
Enable local farmers to quickly find and book nearby trucks, tempos, and tractors for transporting their produce and livestock efficiently.
- **Empower Vehicle Owners and Drivers**
Create an accessible platform for local vehicle owners and drivers to register, offer their services, and earn additional income by serving the agricultural community.
- **Reduce Post-Harvest and Livestock Losses**
Minimize spoilage of perishable agricultural goods and reduce stress-related losses in livestock by ensuring timely and reliable transportation from farms to markets.
- **Improve Last-Mile Logistics Efficiency**
Streamline the connection between farms and markets by optimizing vehicle availability, route planning, and load management for both produce and livestock transport.
- **Enhance Farmer Profitability**
Increase farmers' earnings by reducing transportation delays, minimizing spoilage and livestock losses, and decreasing reliance on costly intermediaries.
- **Promote Rural Economic Development**
Foster economic growth in rural areas by supporting local transportation providers, improving access to nearby markets, and strengthening the agricultural supply chain.
- **Build a Scalable and User-Friendly Platform**
Develop an intuitive web application that grows with demand and adapts to the evolving needs of farmers, livestock owners, and vehicle operators.
- **Provide Live Market Availability and Pricing Information**
Integrate real-time data on nearby market availability for both agricultural produce and livestock, helping farmers make informed decisions on where and when to sell.

Scope of Project:

1. User Roles & Access:

- Farmers: Register, browse nearby available vehicles, book transport for produce and livestock, view live market availability.
- Vehicle Owners/Drivers: Register, list available vehicles (trucks, tempos, tractors), accept transport requests, track earnings.
- Admin: Manage users, vehicles, and monitor platform activity.

2. Core Functionalities:

- **Vehicle Booking System:**

Farmers can search and book nearby vehicles on-demand or schedule transport for future dates.

- **Vehicle Owner Registration & Management:**

Vehicle owners/drivers can register, list vehicles with availability status, and manage bookings.

- **Live Market Availability:**

Real-time updates on market demand, pricing, and livestock availability in nearby markets to help farmers decide when and where to sell.

- **Order Tracking:**

Farmers can track the status and location of their booked transport in real-time.

- **Notifications:**

Alerts and reminders for bookings, vehicle arrival, and market updates.

3. Geolocation and Mapping:

- Integration with maps for locating nearby vehicles and markets.
- Route optimization suggestions for drivers.

4. Data Management:

- Maintain databases of farmers, vehicle owners, vehicles, markets, bookings, and transactions.
- Market data integration through APIs or manual updates.

5. Platform Accessibility:

- Responsive web application accessible on desktops and mobile devices.
- User-friendly interface for non-technical users.

6. Payment Integration (Optional for MVP):

- Support for online payments or cash-on-delivery options.

7. Technology Stack Options:

- **ASP.NET Core (C#):**

Suitable for building a robust, scalable backend with strong security features. Ideal if your team prefers Microsoft technologies and wants to leverage .NET ecosystem benefits.

- **MERN Stack (MongoDB, Express.js, React, Node.js):**

A popular JavaScript-based stack for full-stack development offering fast development cycles, a rich ecosystem, and flexibility for building responsive UIs.

8. Limitations (Out of Scope for MVP):

- Complex fleet management features.
- Advanced AI-based route optimization.

- International or multi-region market data integration (focus on local/regional markets initially).

Mobile app development (initially web-based only).

Literature Review & Public Survey

Sr No.	Title	Author	Category	Institute Scope	Task Performed	Technology	Limitation

Market Survey

Average Distance to the Nearest Market – Survey Insights

This pie chart presents responses from **32 participants** who were asked about how far they typically have to travel to reach the nearest market.

- The largest portion, **43.8%** of respondents (about 14 people), reported living within **0–10 km**, shown in blue.
- **37.5%** (approximately 12 people) indicated a distance of **10–20 km**, represented in red.
- Both **20–30 km** and **more than 30 km** categories were selected by **9.4%** of respondents each (roughly 3 people per group), shown in orange and green, respectively.

Delays in Transporting Produce After Harvest – Farmer Responses

This pie chart summarizes how frequently **35 respondents** experience delays when transporting their produce after harvest.

- The largest group, **42.9%** (around 15 individuals), said they "**sometimes**" face transport delays, marked in orange.
- **34.3%** (approximately 12 people) reported delays "**often**", shown in red.

- **20%** (about 7 respondents) said they "**always**" face delays, represented in blue.
- A small number, **2.9%** (only 1 person), answered "**rarely**" (green).
- **No one** reported "**never**" facing delays, as indicated by the absence of purple on the chart.

Common Modes of Transport for Agricultural Produce

This pie chart presents insights from **35 respondents** about the type of vehicles they typically use to transport their harvested produce.

- A majority, **68.6%** (approximately 24 people), use a **tractor**, represented in blue.
- **28.6%** (around 10 people) rely on a **tempo**, shown in red.
- A small portion, just **2.9%** (1 respondent), use a **cart**, highlighted in orange.

How Farmers Arrange Transportation for Their Produce

This pie chart represents responses from **35 participants** on how they typically manage transportation for their agricultural produce.

- **51.4%** (about 18 people) said they **rent vehicles**, shown in red.
- **34.3%** (around 12 respondents) use their **own (personal) vehicles**, represented in blue.

- The remaining **14.3%** (approximately 5 people) rely on **middlemen** to arrange transportation, marked in orange.

Condition of Roads for Transporting Agricultural Goods

This pie chart captures the views of **35 respondents** regarding the quality of roads in their area for transporting agricultural produce.

- **37.1%** (about 13 respondents) rated the roads as “**adequate**”, shown in red.
- **34.3%** (around 12 people) described the road conditions as “**poor**”, marked in orange.
- Only **28.6%** (roughly 10 individuals) said the roads were “**good**”, represented in blue.

Conclusion: Market Survey Summary

The market survey highlights critical issues affecting farmers during the post-harvest phase:

➤ *Delays & Income Loss*

A majority of farmers report frequent delays in transporting produce after harvest, with over 90% experiencing delays "often" or "sometimes." These delays have led to substantial income losses, with estimates ranging from ₹5,000 to ₹1 lakh, and in some cases, even higher. The losses are primarily due to spoilage and fluctuating market prices caused by late deliveries.

➤ *Crop Sensitivity*

Crops such as tomatoes, bananas, leafy vegetables, and tobacco are especially difficult to transport reliably. Their high perishability and sensitivity to heat and handling make them vulnerable to damage during transit, increasing the risk of financial loss.

➤ *Post-Harvest Challenges*

Farmers face a range of logistical hurdles including:

- Unpredictable weather conditions

- Lack of proper storage facilities
- High transportation costs
- Labor shortages
- Inadequate infrastructure and poor road conditions

These challenges collectively hinder timely market access and reduce the quality and value of agricultural produce.

Gap Identification

Sr. No.	Gap Area	Description
1	Rural Transport Infrastructure Gap	Poor roads and lack of vehicles in remote agricultural regions
2	Cold Chain & Specialized Transport Gap	Inadequate cold storage vehicles and absence of shared climate-controlled units
3	Scheduling & Timeliness Gap	Irregular pickups, delays, and absence of scheduled transport systems
4	Logistics Coordination Gap	Lack of aggregation centres, route optimization, and network efficiency
5	Digital Technology Gap	No digital platforms for booking, tracking, or coordinating transport
6	Market Accessibility Gap	Farmers unable to reach markets on time, leading to spoilage and distress sales

Proposed System

Proposed system for farm to market service

This proposed system blends a narrative overview with structured, point-wise specifics so you can plug it directly into documentation and presentations. It centers on a responsive web platform that matches farmers with nearby vehicles for on-demand or scheduled transport of produce and livestock, augments choices with live market availability and pricing, and provides end-to-end visibility from booking to delivery. The goal is to reduce post-harvest and stress-related losses, improve last-mile logistics, and increase rural incomes by turning idle local capacity into reliable access.

Solution overview

The platform is a geolocation-enabled web application where farmers can discover available trucks, tempos, and tractors; compare estimated arrival times and prices; and book immediately or schedule pickups. Vehicle owners and drivers list vehicles, manage availability, accept jobs, and track earnings. Real-time market availability and pricing help farmers choose the right destination and timing, while live tracking and notifications reduce uncertainty. The MVP prioritizes core booking and tracking, market data integration, and simple payouts, with room to scale into richer logistics tools later.

- I. **Problem focus:** Reduce the approximately one-third post-harvest loss driven by delays and lack of reliable transport, especially for perishables and livestock.
- II. **Primary outcome:** Faster, predictable first-mile movement from farm gate to the optimal nearby market, improving sale prices and reducing spoilage.
- III. **Operating model:** Two-sided marketplace with light-touch operations; local drivers monetize idle capacity, farmers get dependable access.
- IV. **Form factor:** Responsive web application optimized for low-bandwidth rural contexts and multilingual UX.

Core modules and features

Each module is designed to be independently deployable and testable, enabling a lean MVP that can expand as adoption grows.

- I. **Authentication and onboarding:** Email, phone OTP, and assisted onboarding for non-technical users; role-based access for farmers, vehicle owners, and admins.
- II. **Farmer booking:** Search by location and load; choose vehicle type; on-demand or scheduled bookings with fare estimates and ETAs.
- III. **Driver supply:** Vehicle listing, availability toggles, acceptance windows, earnings dashboard, and simple compliance checks.

- IV. **Market intelligence:** Live updates on nearby market demand, typical prices, and livestock intake windows; simple recommendations for timing and destination.
- V. **Live tracking:** Real-time vehicle location during active bookings; status updates from requested to en route, arrived, loaded, and delivered.
- VI. **Notifications:** SMS, WhatsApp, and in-app alerts for confirmations, arrivals, delays, and market shifts.
- VII. **Geospatial services:** Nearby vehicle discovery, route suggestions, and distance-based pricing support.
- VIII. **Payments and settlements:** Cash on delivery and later digital payments; escrow or proof-of-delivery for disputes.
- IX. **Admin console:** User and vehicle verification, dispute resolution, fraud monitoring, content and market data management.
- X. **Analytics:** Usage trends, route efficiency, cancellation rates, on-time delivery, and market matching accuracy.

Methodology & Workflow

The project will follow a structured, phased approach, starting from requirement gathering to deployment, ensuring continuous validation with stakeholders. The methodology combines user-centric design with iterative development, enabling early feedback and rapid refinement.

Phases & Flow

- 1. Requirement Analysis & Planning**
 - Engage with farmers, vehicle owners, and market representatives to refine needs.
 - Define functional and non-functional requirements.
 - Prepare an initial work plan and technology stack decision.
- 2. System Design**
 - Draft UML diagrams (Use Case, Class, Sequence, Activity) to model workflows.
 - Create system architecture covering frontend, backend, database, and integrations (maps, market data APIs).
- 3. Prototype Development**
 - Build an initial web-based prototype with core booking and tracking features.
 - Integrate geolocation and live market information modules for proof of concept.
- 4. Implementation & Integration**
 - Develop individual modules (booking, user management, market data, notifications) and integrate into a single platform.
 - Conduct internal testing for performance, usability, and security.
- 5. Testing & Validation**
 - Functional testing (vehicle search, booking, market data accuracy).
 - User acceptance testing with a pilot group of farmers and drivers.
 - Refine system based on feedback.
- 6. Deployment & Training**
 - Deploy on a scalable web host.
 - Train end-users (especially non-technical rural users) through simple guides and on-site demos.
- 7. Monitoring & Maintenance**
 - Track performance metrics such as booking fulfillment rate and delivery times.
 - Apply updates for security, new features, and bug fixes.

Workflow Summary

The process begins with requirements gathering, flows into design and prototyping, advances through development and integration, is refined by testing with real stakeholders, and culminates in deployment with ongoing support. Each phase loops back with feedback to ensure the platform remains reliable, intuitive, and impactful for both farmers and vehicle owners.

Tools/Technologies

Category	Tool / Technology	Purpose / Justification
Frontend Development	React.js(MERN)	Build a fast, responsive, and interactive user interface accessible on desktop & mobile browsers.
Backend Development	Node.js with Express.js	Handle core business logic, APIs, and integrate with databases and external services efficiently.
Database	MongoDB	Store and manage user, vehicle, booking, and market data in a flexible, scalable NoSQL format.
Real-time Features	Socket.IO	Enable live vehicle tracking, instant notifications, and booking status updates.
Geolocation & Maps	OpenStreetMap + Leaflet.js	Locate nearby vehicles and markets, and provide route suggestions.
Market Data Integration	RESTful API integrations or manual data entry modules	Display live market availability and pricing for produce/livestock.

UML Diagrams (Use Case, Class, Sequence, Activity)

UML Diagram:

UML Diagram (Unified Modeling Language Diagram):
A UML diagram is a visual representation used in software engineering to model the structure and behavior of a system. It helps developers and designers understand, design, and document software systems effectively.

Sequence Diagram:

A Sequence Diagram is a type of UML diagram that shows how objects interact with each other in a particular sequence of time. It focuses on the order of messages exchanged between system components to carry out a specific process.

Description:

In this project, the sequence diagram illustrates the vehicle booking process between the Farmer, System, Vehicle Database, Driver/Vehicle Owner, and Payment Gateway.

1. The Farmer requests a vehicle through the System.
2. The System checks availability from the Vehicle Database.
3. The Database returns the result and notifies the Driver/Vehicle Owner.
4. The Driver/Vehicle Owner accepts or rejects the booking.
5. If accepted, the System confirms the booking and proceeds with payment confirmation via the Payment Gateway.
6. Finally, ride details are sent to the Farmer.
7. If rejected, a notification of rejection is sent to the Farmer.

Structure Diagram:

A Sequence Diagram is a type of UML diagram that shows how objects interact with each other in a particular sequence of time. It focuses on the order of messages exchanged between system components to carry out a specific process.

Description:

In this project, the sequence diagram illustrates the vehicle booking process between the Farmer, System, Vehicle Database, Driver/Vehicle Owner, and Payment Gateway.

1. The Farmer requests a vehicle through the System.
2. The System checks availability from the Vehicle Database.
3. The Database returns the result and notifies the Driver/Vehicle Owner.
4. The Driver/Vehicle Owner accepts or rejects the booking.
5. If accepted, the System confirms the booking and proceeds with payment confirmation via the Payment Gateway.
6. Finally, ride details are sent to the Farmer.
7. If rejected, a notification of rejection is sent to the Farmer.

Class Diagram:

A Class Diagram is a type of UML (Unified Modeling Language) diagram that visually represents the static structure of a system. It shows the system's classes, their attributes, methods, and the relationships between them.

Description:

Class Name	Attributes	Methods
Farmer	farmerID, name, contactInfo, location	bookVehicle(), schedulePickup()
Booking	bookingID, farmerID, vehicleID, pickupTime, status	confirmBooking(), cancelBooking()
Vehicle	vehicleID, type, capacity, availability	updateAvailability()
Driver/Vehicle Owner	ownerID, name, license, contactInfo	registerVehicle(), acceptBooking()

Fresh. Direct. Efficient.

Your Harvest, Delivered

Welcome to AgriLink. We bridge the gap between farm and market, ensuring your produce is transported safely, efficiently, and on time. Maximize your profits with streamlined logistics.

Ship with Us

Become a Transporter

Why Choose AgriLink?

We provide a seamless logistics platform for farmers and transporters, focusing on reliability, quality, and fair pricing.

Reliable Transport

Our network of verified transporters ensures your produce is picked up on schedule and delivered promptly.

Safe & Fresh Delivery

We prioritize the safety and freshness of your harvest with proper handling and optional temperature-controlled vehicles.

Transparent Pricing

Get fair, upfront pricing for every shipment. Know your costs before you book and ensure you get the best value.

From Our Farming Community

Hear from farmers and transporters who trust AgriLink for their business.
